Supporting Information

General Techniques. All reagents were commercially obtained (Aldrich, Acros) at highest commercial quality and used without further purification except where noted. Air- and moisture-sensitive liquids and solutions were transferred via syringe or stainless steel cannula. Organic solutions were concentrated by rotary evaporation below 45 °C at approximately 20 mmHg. All non-aqueous reactions were carried out under anhydrous conditions using flame-dried glassware within an argon atmosphere in dry, freshly distilled solvents, unless otherwise noted. Tetrahydrofuran (THF), diethyl ether (Et₂O), dichloromethane (CH₂Cl₂), toluene (PhCH₃) and benzene (PhH) were purified by passage through a bed of activated alumina.¹ N,N-diisopropylethylamine (DIPEA), diisopropylamine, pyridine, triethylamine (TEA) and boron trifluoride etherate were distilled from calcium hydride prior to use.² Dimethyl sulfoxide (DMSO) and dimethylformamide (DMF) were distilled from calcium hydride under reduced pressure (20 mmHg) and stored over 4Å molecular sieves until needed. Yields refer to

chromatographically and spectroscopically (\textsuperscript{1}H NMR, \textsuperscript{13}C NMR) homogeneous materials, unless otherwise stated. Reactions were monitored by thin-layer chromatography (TLC) carried out on 0.25 mm E. Merck silica gel plates (60F-254) using UV light as the visualizing agent and 10% ethanolic phosphomolybdic acid (PMA) or \textit{p}-anisaldehyde solution and heat as developing agents. E. Merck silica gel (60, particle size 0.040-0.063 mm) was used for flash chromatography. Preparative thin-layer chromatography separations were carried out on 0.25 or 0.50 mm E. Merck silica gel plates (60F-254). NMR spectra were recorded on Varian Mercury 300, 400 and/or Unity 500 MHz instruments and calibrated using the residual undeuterated solvent as an internal reference. The following abbreviations were used to explain the multiplicities: \textit{s} = singlet, \textit{d} = doublet, \textit{t} = triplet, \textit{q} = quartet, \textit{m} = multiplet, \textit{b} = broad. IR spectra were recorded on a Nicolet 320 Avatar FT-IR spectrometer and values are reported in cm\textsuperscript{-1} units. Optical rotations were recorded on a Jasco P-1010 polarimeter and values are reported as follows: $[\alpha]_{25}^D$ (c: g/100ml, solvent). High resolution mass spectra (HRMS) were recorded on a VG 7070 HS mass spectrometer under chemical ionization (CI) conditions or on a VG ZAB-ZSE mass spectrometer under fast atom bombardment (FAB) conditions.

**Key experimental procedures**

Iodide 7: Imidazole (6.86 g, 101mmol) and iodine (23.0 g, 90.7 mmol) were added sequentially to a solution of triphenylphosphine (21.1 g, 80.6 mmol) in dichloromethane (250 ml) at 23°C. A solution of alcohol 4 (12.1 g, 67.2 mmol) in dichloromethane (30 ml) was added to the resulting fine suspension via cannula. After 2 h, dichloromethane was removed \textit{in vacuo}. The resulting suspension was warmed to 0°C briefly and then was cooled to −78°C. An ice-cooled solution of amide (+) 8 (8.12 g, 36.7 mmol) in THF (110 ml, followed by a 4-ml rinse) was added via cannula.
